(54) METHOD AND SYSTEM FOR RETRIEVING INFORMATION

(57)Abstract

PROBLEM TO BE SOLVED: To realize bi-directional cross matching retrieval fulfilling the mutual requests with the communicating party side via the Internet or the like.

SOLUTION: Basic information (B) related with an information provider and variable condition information (T) to be requested to the communicating party are stored in a data base part 34 for providing information. Also, basic information (b) related with an information retriever and variable condition information (t) to be requested to the communicating party are stored in a retrieval information temporarily preserving area 33. Then, cross matching retrieval for establishing a formula: $[(B)=(t)]$ and $[(b)=(T)]$ is performed via a data collating part 35, and the retrieved results fulfilling the mutual retrieval conditions of the information provider and the information retriever are listed up.
